

REACH Screen Lock Security measure

REACH version 3.3.179 published on 6th June 2018 for Cloud portals has a new screen lock security measure which has been added to REACH to implement global best practice for access to private and secure databases.

This update provides for an automatic Lock Screen action and also an automatic Log Out function for idle user accounts.

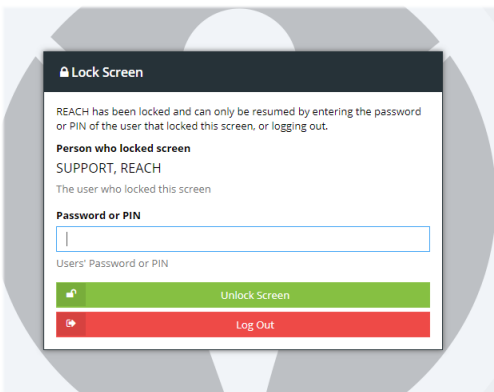

The default settings for these functions are;

Screen Lock Screen lock on Idle (number of minutes).

Default for your portal is **5 minutes**. This will lock the screen and require PIN or password to reactivate.

Log Out Log user out on idle (number of minutes).

Default for this is **30 minutes**. This will log the user out if their session has been idle for the period set and require login to reactivate.

How to change your Security Lock settings

Portal administrators can manage these settings for your portal in the General Settings of your System Configuration. ([System Configuration > General](#))
